### **Abstract**

The development of digital technology has changed the way people interact and carry out economic activities, giving rise to the concept of a digital economy. In Indonesia, the digital economy is growing rapidly and is one of the sectors that contributes to national economic growth. This study aims to explore the extent to which the digital economy plays a role in driving economic growth. This study uses a literature review method, namely an approach carried out by reviewing, analyzing and synthesizing various relevant literature sources. This study identifies consistent patterns and findings regarding the positive impact of the digital economy on economic growth. The results of this analysis indicate that the development of the digital economy is an important strategy for developing countries in realizing sustainable growth.

**Keywords:** Digital Economy, Economic Growth

---

### **INTRODUCTION**

The development of information and communication technology in the last twenty years has brought about major changes in human life, both in the way of interacting and in carrying out economic activities. This phenomenon then gave rise to a new concept in the economy which is now known as the digital economy. This digital economy is an economic activity supported by digital technology such as the internet and digital media such as e-commerce and other application-based services.

---

In Indonesia, economic activities using digital media are growing very rapidly and have become one of the strategic sectors that are believed to be able to drive national economic growth. The surge in the growth of technology startups and the increasing use of transactions by micro, small and medium enterprises show that the digital economy is one of the factors in the change of the national economy.

With this, the government is currently paying attention to this sector through various policies that support digital-based economic activities.

The digital economy has its own challenges, where in developing countries there is a digital divide, low and uneven digital knowledge, and infrastructure inequality in accessing the internet. In addition, there are still many issues related to data security and consumer protection that use digital platforms for transactions, this is important to get more attention so that it can develop a sustainable digital economy. Although the development of the digital economy is very promising, it still needs to be studied more deeply about the extent to which the digital economy contributes to economic growth.

## **METHOD**

This study uses a literature review method, namely an approach carried out by providing, analyzing and synthesizing various relevant library sources. This study collects library information and data using sources such as books, journal articles and other sources that are appropriate and related to the research being conducted, then synthesized using narrative methods and grouping similar data according to criteria.

This method aims to gain a comprehensive understanding of concepts, theories and previous findings that can be used as a basis for analysis in explaining the relationship between the variables being studied. Data is collected and made into a summary including the title of the study, the name of the researcher, the name of the publishing journal, methods and results and findings. The existing data is then reviewed to find similarities and differences and then discussed in order to draw conclusions.

## **RESULTS AND DISCUSSION**

Based on the results of the journal analysis, several supporting journals were found to strengthen this literature review. The researcher collected some information from each research literature, the three pieces of information are the criteria for the subjects used in the research, the methods used in the research and the last is the research results related to the Influence of the Digital Economy on Economic Growth

From several literatures that have been presented and analyzed, the majority of studies show that the digital economy has a significant influence on economic growth. The majority of these studies use quantitative methods using secondary data that can be used by researchers to measure the impact of the digital economy more objectively and measurably.

Research conducted by Krismonica Lubis and Bakhtiar (2023) and Ardian Alif Mustofa et al. (2024) using the literature study method concluded that economic digitalization plays an important role in driving economic growth. Other research conducted by H.N Au Yong et al. (2020) and Denita Capridasari (2024) shows a significant relationship between digital transformation and economic growth.

Research conducted by Zhenyi Mawang and Lai Wei Sieng (2024) concluded that there was an impact of the digital economy on regional growth in the ASEAN region. This shows that the positive impact of the digital economy does not only occur in one country, but is widespread geographically.

## **CONCLUSION**

From all the literature that has been reviewed, it is concluded that the digital economy has a positive and significant impact on economic growth. This can be seen from the consistent results of various studies that also cover different regions and approaches. The digital economy, both through the use of technology, the internet and digital platforms, has been proven to increase economic efficiency, expand employment opportunities, and accelerate economic growth. Therefore, the development of the digital economy is an important strategy for developing countries including Indonesia, to encourage sustainable economic development.
